OPTAIN : Bassin de la Petite Glâne

Year of issue

2025

Summary

The case study area “Petite Glâne” belongs to the Broye catchment in the southwestern part of the Swiss Plateau. The river Petite Glâne is about 30 km long, repeatedly crosses borders between the cantons of Vaud and Fribourg, and has a catchment area of 94 km2. Its upper reaches have remained fairly natural and are lined with forest, whereas its lower reaches in the Broye plain have been canalized and straightened. The soils and climate here are highly suitable for arable farming. Overall, the catchment of the Petite Glâne is strongly characterized by agriculture: nearly three quarters of its area consists of pastures and cropland. However, the region is increasingly experiencing water shortages in summer, and there is often not enough water in the Broye and Petite Glâne to irrigate the fields. Climate change will further aggravate the situation. Farmers are therefore considering new options to mitigate the increasing drought events – for example an irrigation project using water from Lake Neuchâtel.

Against this background, OPTAIN explores efficient land use and land management strategies as well as technical measures that increase the capacity of soils to absorb and store water while improving nutrient retention and decomposition. These natural and small water retention measures (NSWRMs) are discussed and evaluated jointly with regional stakeholders. Based on model calculations, OPTAIN works to determine the maximum possible water and nutrient retention potential that can be achieved with NSWRMs if they are optimally combined and positioned in the catchment. Although the focus is on the Petite Glâne, the case study extends to the entire Broye catchment when it comes to modelling and stakeholder involvement.

The OPTAIN project will support the case study team with identifying and developing efficient land management strategies and small technical solutions to improve the soils’ infiltration and water holding capacities as well as its capacity to filter, buffer and transform pollutants.

Policy and Governance

Policy description

Project developed in coordination with the following stakeholders: Authorities of the agricultural sector, authorities of the environment sector, famer associations, local farmers, NGOS, and AGRIDEA

Policy targets

Improved Biodiversity

Part of a wider plan

Oui

Public consultation

Non

Consultation activities

Activity stage	Activity type	Key issues

Screening phase	MARG workshop	The project involves a Multi-Actor Reference Group (MARG) composed of farmers, local and regional authorities, NGOs, and researchers to co-develop realistic solutions tailored to regional challenges. Engagement with local communities and stakeholders.

Has contractual arrangements
